

Unprotected battery cables from the battery to the inverter. Not even close to compliant.

Not compliant – battery DC cable is visible. Unlike solar DC no exposed battery DC cable is allowed. Don't get me started on the stickers...

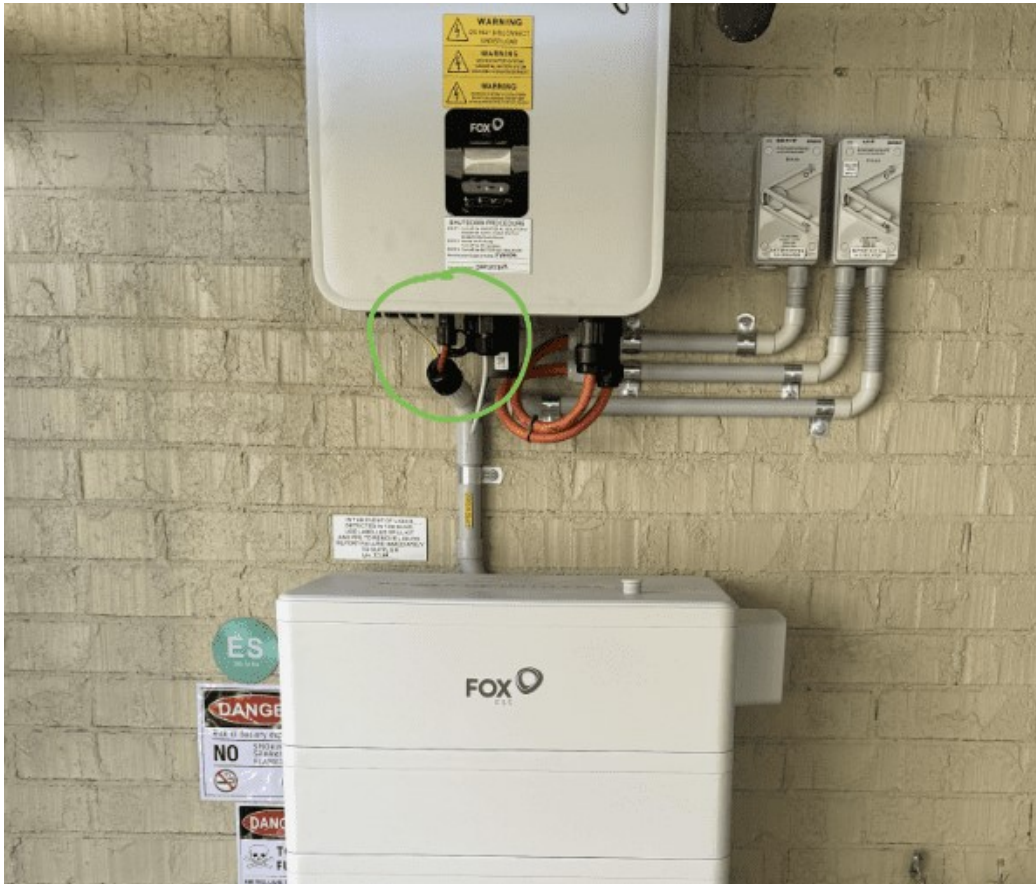

Does not comply

Inverter looks good: shame about the exposed DC at the battery.

Nice and neat. Not compliant.

Close – but no cigar.

An example of battery cables with proper protection.

Yes I bought a FoxESS KH9.9 plus EQ4800-L9, (I'm feeling now that I wish I hadn't) and looking at the instal now all after it's been 'inspected' by Access Canberra Inspections mine is similar to most of the others here with no mechanical protection, but would certainly benefit from having it.

I read that Fox ESS has taken action in recent months on this, such as providing free mechanical covers(??)... so how do we get these 'free mechanical covers' and really they should have been part on the installation kit supplied, and also one of the suppliers, installers, or electricians who did my install should have made me aware that they were available, even at an extra cost.

There just a bunch of cowboys, you can't get in contact with any of them, they just ignore you. It's so disappointing.
